useful h factor homologs and the nucleic acids that encode them, us for treating liver damage, ischemia, multiple sclerosis and Growth factor homologs disease e.g. for tre Alzheimer's

English Claim 25; Page 123-125; 143pp; The invention relates to the human growth factor homologue zvegf4

C (AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4 is a member

CC of the PDGE (Diatelet-Lederived growth factor)/YGGE (vascular endothelial

growth factor) family. Zvegf4 has a growth factor and a CUB domain

CC (AAA8653) which has a beta barrel structure. Zvegf4 has PDGF-like

CC (AAA8653) which has a beta barrel structure. Zvegf4 has PDGF-like

CC (AAA8653) which has a beta barrel structure. Zvegf4 has PDGF-like

CC (AAA8653) which has a beta barrel structure. Zvegf4 has PDGF-like

CC quowin. The invention also relates to fusion proteins comprising human

C zvegf4 or fragments thereof, particularly human zvegf4/human zvegf4

CC fusions; expression constructs and host cells comprising human zvegf4 or fragments thereof, particularly human zvegf4/human zvegf4

CC fusions; expression constructs and host cells comprising human zvegf4

CC fusions in the zvegf4 or a fragment thereof; a method of activating

CC acell-surface PDGF receptor using a zvegf4-derived polypeptide; a

CC method of modulating the proliferation, differentiation or

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived polypeptides; and a method of detecting a genetic

CC zvegf4-derived po used to enhance expansion and mobilisation of haematopoietic stem cells and endothelial precursor stem cells, which may be useful in the treatment of ischaemia, in wound healing, and in the modulation of the the modulation of the Immune system. The present sequence represents DNA encoding human

factor domain and a CUB domain (generic sequence motifs are shown in AAY96850). The growth factor domain is characterized by an arrangement of cysteine residues and beta-strands that is characteristic of the "cysteine knot" structure of the platelet-derived growth factor (PDGF) family. The CUB domain shows homology to CUB domains in neuropilins, human bone morphogenetic protein-1, porcine seminal plasma protein, bovine acidic seminal fluid protein and Xenoqus laevis tolloid-like protein. Structural analysis and homology predict that 2VEGF3 polypeptides complex with a second polypeptide to form multimeric proteins. The human zvegf3 gene has been mapped to chromosome 4q28.3 LVEGF3 is useful for stimulating the growth of fibroblasts or smooth muscles cells, for activating call surface PDGF-alpha receptor and for inhibiting PDGF-alpha receptor mediated cellular processes. ZVEGF3 is useful for treating cancer, rheumatoid arthritis, and maintenance, as well as tissue maintenance and repair processes. ZVEGF3 antagonists are useful for treating cancer, rheumatoid arthritis, atherosclerosis, wound healing, chronic liver disease and haemangioma chemical and processes and healing, chronic liver disease and haemangioma content of the normal surface mediate neurity growth and healing, chronic liver disease and haemangioma content of the normal surface mediate neurity growth and healing, chronic liver disease and haemangioma contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  540

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antisponiatic and antidabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention and organ for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote logenic activity or protein described skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity vascularization. This sequence encodes a human VEGF-X protein describe in the method of the invention.

Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, psoriais, inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachexia and autoimmune diseases e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial Cransgenic animals and for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a clistorder associated with aberrant TANGO expression. A wide range of cellular disorders can be treated.

This sequence represents cDNA encoding human growth factor related molecule GFRP-4. CDNA encoding GFRP-4 was initially identified in a diseased breast tissue cDNA library, and the present sequence represents a consensus derived from several overlapping and/or extended cDNA clones. GFRP-4 has chemical and structural homology with human bone morphogenetic protein 1 (BMP-1) (27% identity at the BMP-1 C-terminus). GFRP-4 was found by Northern analysis to be expressed in reproductive and cardiovascular tissue, and in cDNA libaries associated with cancer. Inflammation and the immune response. GFRP proteins (AAB03000-B03003), nucleotides encoding them (AAA52458), GFRP agonists and cardions any be used to treat a wide variety of diseases associated with increased or decreased expression or activity of GFRP proteins. Conditions which may be treated include developmental disorders, cell proliferative disorders (e.g., cancers), immune disorders (e.g., cancers) and clisorders (e.g., menstrual cycle disorders) cardiovascular disorders (e.g., menstrual cycle disorders) cardiovascular disorders (e.g., arteriosclerosis) and bacterial, viral, fungal or parastitc infections. Additionally, GFRP proteins and nucleotides can be used in the diagnosis of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

This invention describes the isolation of a novel human vascular endothelial cell growth factor-E (VEGF-E) polypeptide which has endothelial cell growth factor-E (VEGF-E) polypeptide which has crandothelial cardiant activity. VEGF-E can be administered therapeutically especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially cardiovascular or endothelial disorders in mammals, especially can be combined with a carrier in pharmaceutical compositions, which regeneration, and may especially be used to treat cardiac hypertrophy cardiopanic disorders in mammals (especially humans) e.g. cancer or screen for antaqonists and agonists, and the antaqonists administered to treat angiogenic disorders in mammals (especially humans) e.g. cancer or screen for antaqonists, as above. The antibodies are also useful therapeutically as antaqonists, as above. The antibodies are also useful therapeutically as antaqonists, as above. The antibodies are also useful to detect VEGF-E polypeptide, especially to diagnose are also cardiovascular, endothelial or angiogenic disorders in mammals (e.g. vascular disease, or neovascularization associated with tumor formation of an antibody-VEGF-E polypeptide complex. Polynucleotides encoding VEGF-E can be used to diagnose cardiovascular and endothelial disorders con mammals, by detecting abnormally high or low VEGF-E gene expression in tissue samples. They can also be used to diagnose a disease or susceptibility to a disease related to a mutated form of VEGF-E cardiovascular, endothelial or angiogenic disorder such as a tumor), by detecting a mutation in the VEGF-E-encoding sequence isolated from a sample. They may also be used to produce probes useful to detect related sequences or for gene mapping. This sequence encodes the human VEGF-E
                                                                                                                                                                                                                                                                                                                                                                      VEGF-E; human; vascular endothelial cell growth factor; wound repair; treatment; cardiovascular disorder; endothelial disorder; therapy; tissue generation; regeneration; cardiac hypertrophy; cancer; detection; anglogenic disorder; age-related macular degeneration; vascular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or

```
The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated disorders. They may also be used to raise and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAY41685 to AAY41774 represent polypucleotide and polypeptide sequence given in the exemplification of the present

                                                                                                                                          AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78897 represent PCR primers and probes used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (ATCC 209653) isolated from a human glioma cell line G61 cDNA library using probes (see AAA88523-26) based on an expressed sequence tag (see AAA88523) identified on the basis of homology to vascular endothelial growth factor (VEGF). The clone contains a single open reading frame encoding a 345-amino acid protein (see AAB19578) designated PRO200 or VEGF-E. The isolated cDNA can be used in the recombinant production of PRO200 (VEGF-E). The invention relates to to the use of PRO puppeptides, including PRO200, to delay, prevent or rescue retinal ganglion cells, displaced retinal ganglion cells, amacrine cells, displaced amacrine cells, displaced sumacrine cells, displaced sumacrine cells, displaced sumacrine cells, and complement of the use of PRO puppertive cells (including Mueller cells and pigment epithelial cells) from injury and degradation. The retinal cells are preferably photoreceptors and photoreceptor cell injury or

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, 5jogran's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroidisis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases, allergic diseases, autoimmune or immune-mediated skin diseases, allergic diseases, autoimmune or immune-mediated skin diseases, allergic diseases.

Autoimmune or immune-mediated properment and graft-versus: host-disease.

AAC58371 to AAC5878 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAC58579 to AAC58642 and AAC5837414 to AAC5877 represent human PRO polynoleotide and protein nseq Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus present invention. given in the exemplification of the Fig 1; 309pp; English Claim 23; sednences

inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       480

The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a manmal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, angina, mycoardial infarctions, thrombophlebitis and lymphanditis. The PRO polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating periodontal diseases. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      prevent tumour angiogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and tissue regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                anti-PRO antibodies are useful slial or angiogenic disorder.

proteins PRO526, PRO719, PRO725, PRO1031 and PRO200. These proteins, their coding sequences and antibodies can be used in the treatment of immune-related diseases, including systemic lupus erythematosus. Theumatoid arthritis, thyroiditis, immune-mediated renal disease, demyelinating diseases such as multiple sclerosis, hepatobiliary diseases including primary biliary cirrhosis, inflammatory bowel disease, immune-mediated skin diseases such as psoriasis, allergic diseases including asthma, immunologic diseases of the lung, transplantation associated diseases and infectious diseases such as HIV and hepatitis.
                                                                                                                                                                                                                                                                   present invention discloses the coding and protein sequences of human
                                                                                            New compositions containing a PRO526, PRO719, PRO725, PRO1031 or PRO200 proteins for modulating immune response or proliferation of T-lymphocytes in mammal, especially for treating immune related disorders, e.g. graft rejection
                                                                                                                                                                                                                 Claim 21; Fig 9; 133pp; English.

```
The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO protein, agonists or antagonists of a PRO protein, additionally encompasses methods of identifying modulators of PRO expression or activity; alagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a
                                                                                                                                                                cardiac hypertrophy; cardiovascular disorder; endothelial disorder; analogenic disorder; atherosclerosis; osteoporosis; hypertension; myocardial infarction; diabetic retinopathy; rheumatoid arthritis; Crohn's disease; psoriasis; endometriosis; ulcer; wound healing; cancer; Alzheimer's disease; Huntington's disease; stroke; drug screening;

disorder via the administration of a PRO protein, PRO nucleic acid, or disorder via the administration of a PRO protein, PRO nucleic acid, or PRO acidis and methods of inhibiting or stimulating endothelial or PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as atherosclerosis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                types present in biological samples. The polynucleotides can be used in gene therapy to promote the growth of endothelial cells. The present sequence represents a cDNA (clone HETAB62) encoding a BMP of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention provides novel human bone morphogenic proteins (BMP) and nucleic acids encoding the BMPs. The BMP polypeptides can be expressed by standard recombinant methodology. Determining the presence or absence of a mutation in the polynucleotides or determining the presence or absence pathological condition or a susceptibility to a pathological condition in a subject. The polynucleotides can also be used to prevent, treat or ameliorate a medical condition. The proteins are useful for diagnosis and/or treatment of diseases associated with BMPs, in particular bone disorders (e.g. osteoarthritis, cartilage defects and tissue repair), and in particular for stimulation of angiogenesis. The polynucleotides are useful as reagents for differential identification of tissues or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel cDNA encoding human bone morphogenic proteins, vectors, host cells and methods of recombinant production, useful for diagnosis and treatment of, e.g. bone disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
